

Conditional copy-number evaluation on three 10-Mb source genomes

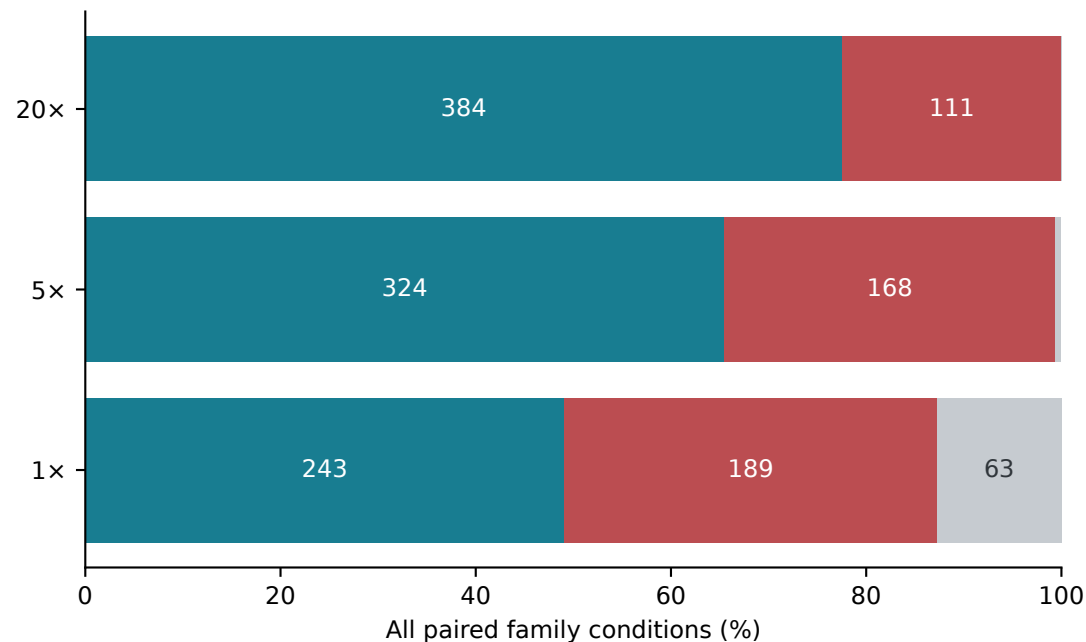

A Bias across error and divergence at 20x

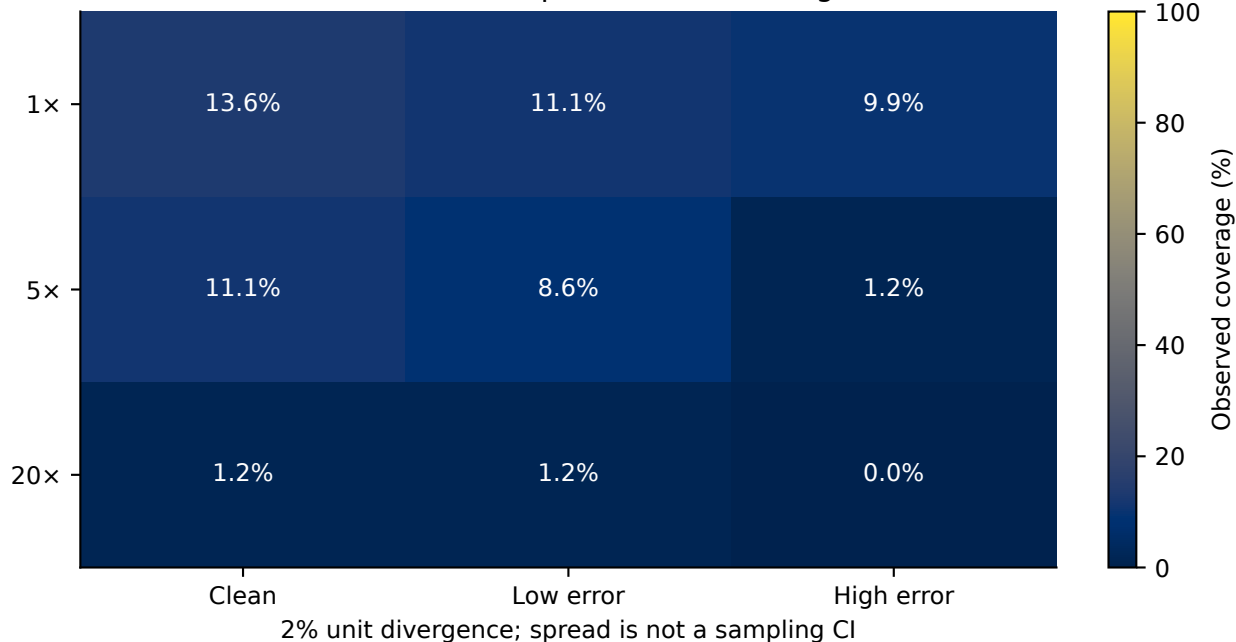

B Higher-error reads with 2% unit divergence

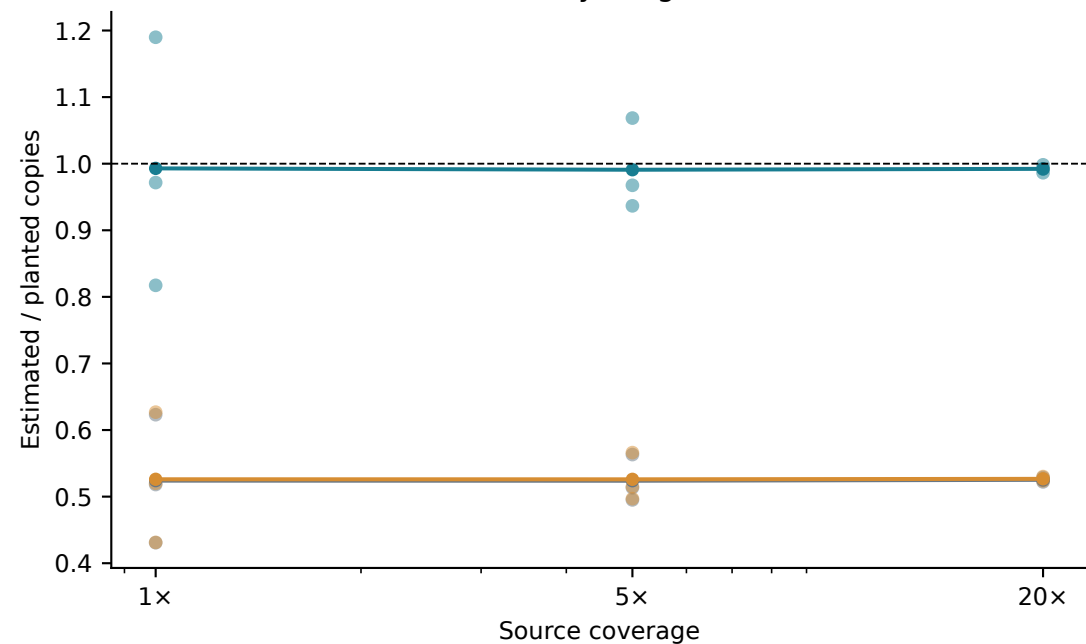

C Multi-k versus native median: all outcomes

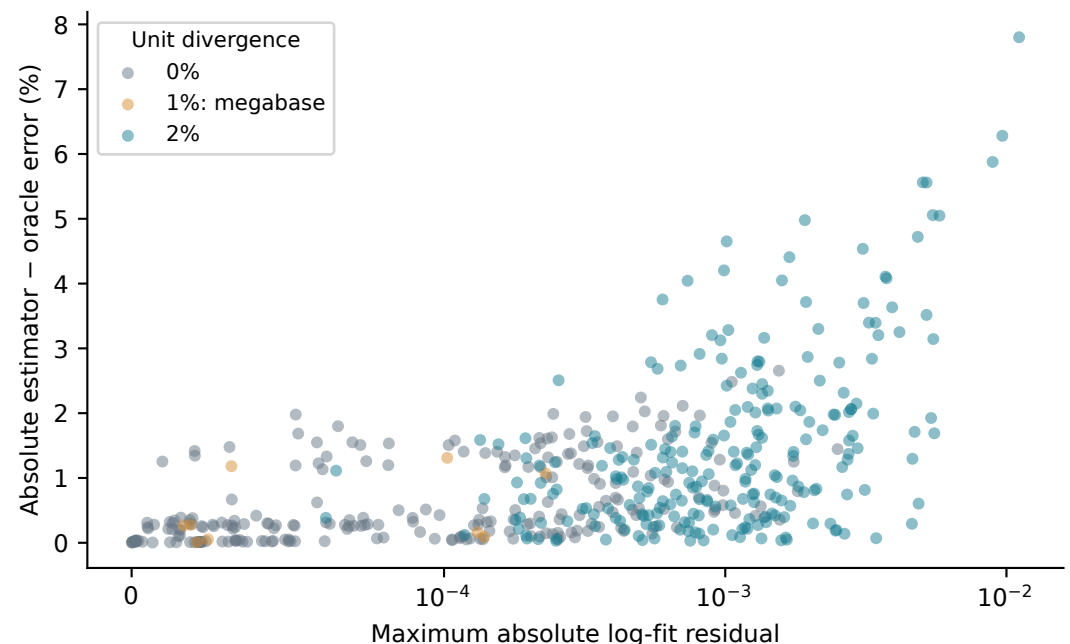

D Native k-mer spread truth coverage

E 1.026-Mb arrays, high read errors

F Fit residual does not establish calibration

Development data · 55 families/genome · 27 paired read conditions · points are not independent plants
