

Ey15-2 donor-matched assembly-collapse validation

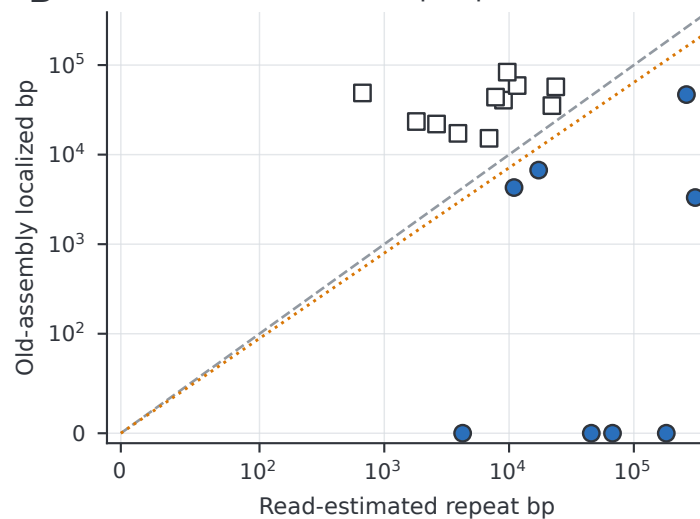

Complete HiFi reads; CLR-Canu old assembly; HiFi-Hifiasm reference proxy; frozen 15-kb primary denominator (n=19)

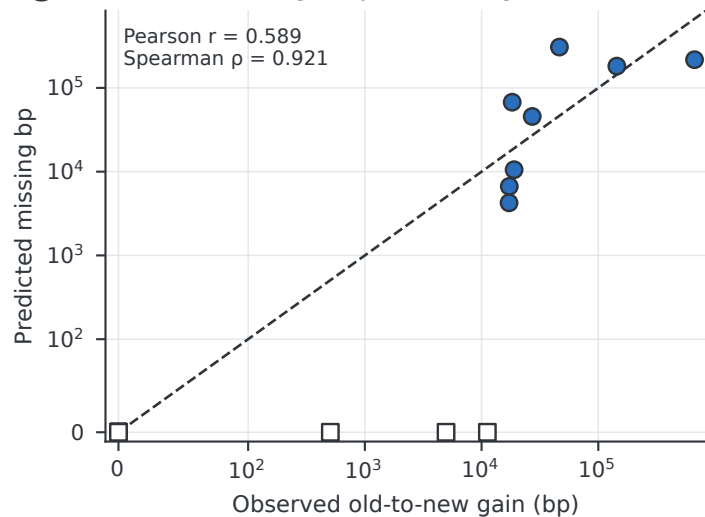

A Assembly reference states

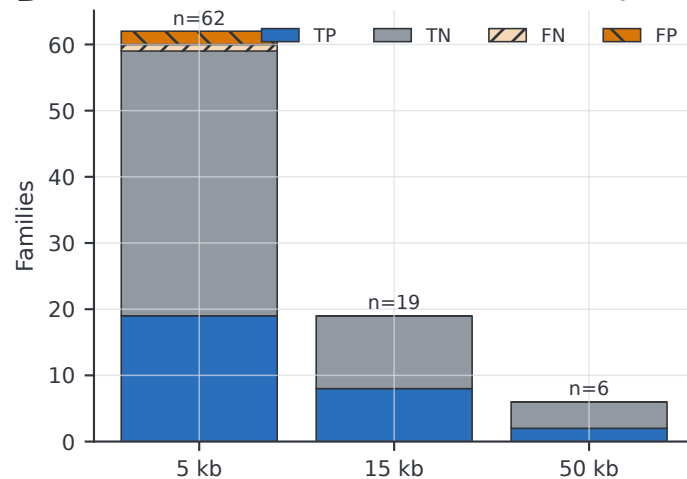

B Read-based collapse predictions

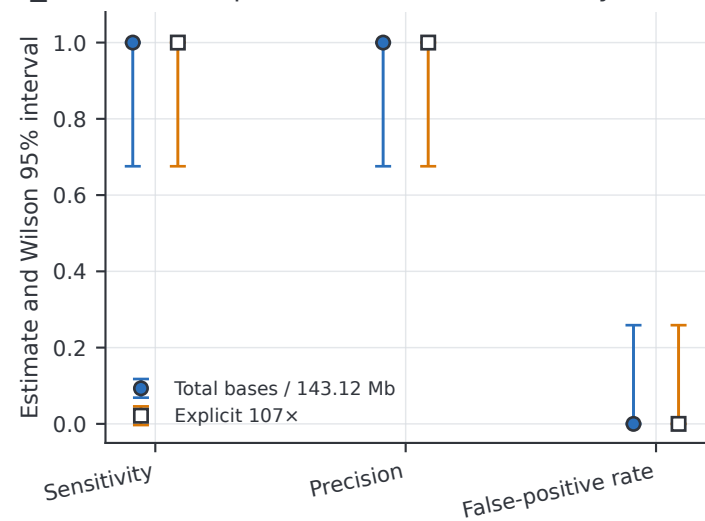

C Missing-sequence magnitude

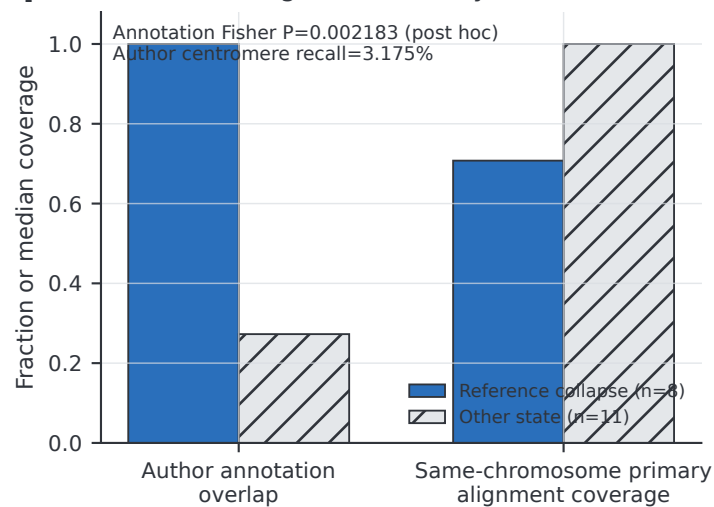

D Predeclared denominator sensitivity

E Depth-normalization sensitivity

F Orthogonal assembly context

High-quality reference proxy, not absolute truth. New assembly shares HiFi evidence; same reads underlie both normalization choices. Full family fates and failures remain in source tables.
