

Divergence-aware anchor bridging passes predeclared localization gates

A Predeclared validation design

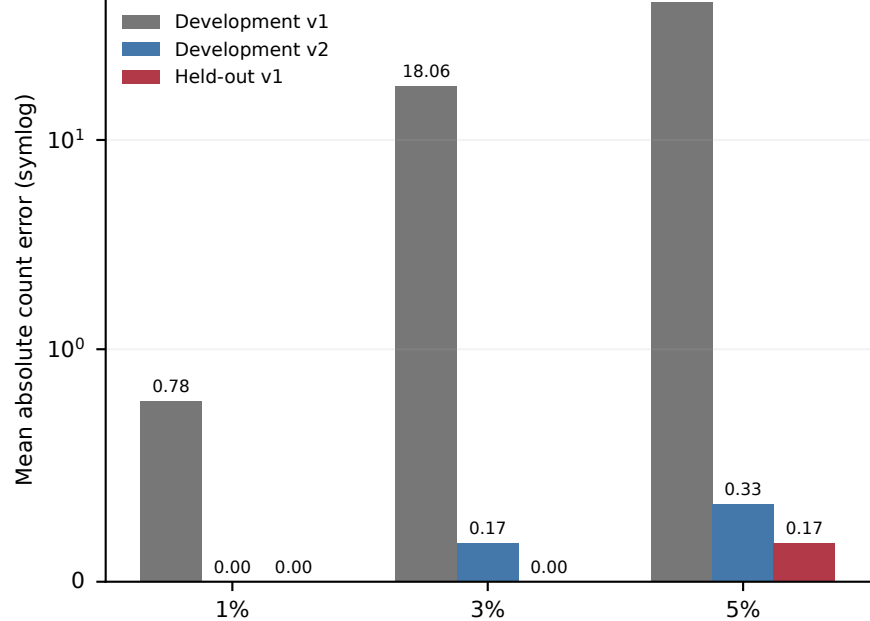

Failed development	3	seeds 5301-5303; v1
Selected development	3	same seeds; bounded bridge
Held-out genomes	3	fresh seeds 5501-5503
Array scenarios	6	1/3/5% x 1/3 segments
Held-out commands	1,062	locate + quantify + compare

Known catalogue; substitutions only; no biological truth

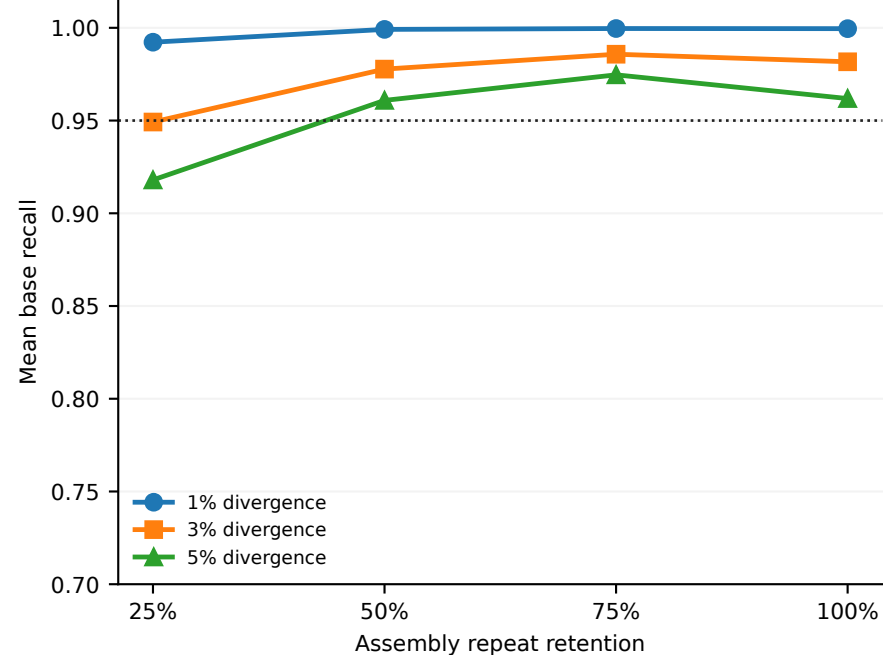

B Full-assembly localization recall

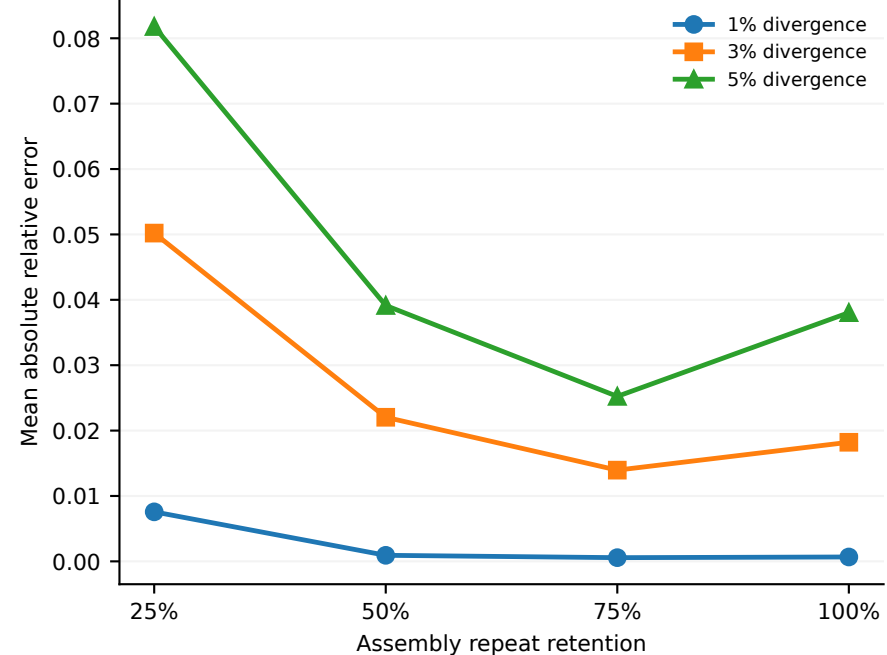

C Predicted array fragmentation

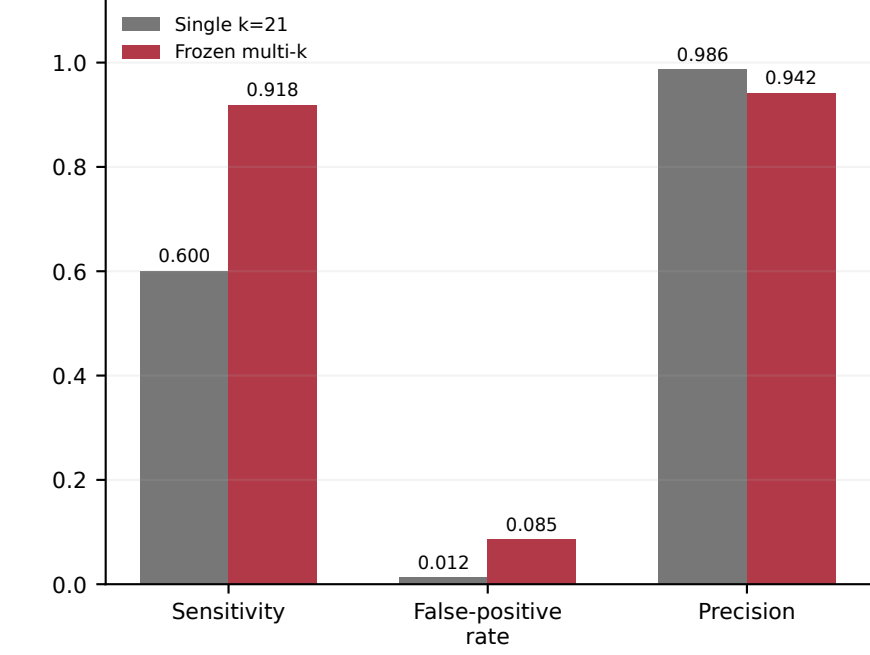

D Held-out recall across collapse

E Held-out localized repeat-bp error

F Assembly/read classification

Fresh seeds validate localization; the frozen multi-k classifier gains sensitivity while increasing false positives.
