

Evaluation definitions and monomer resolution

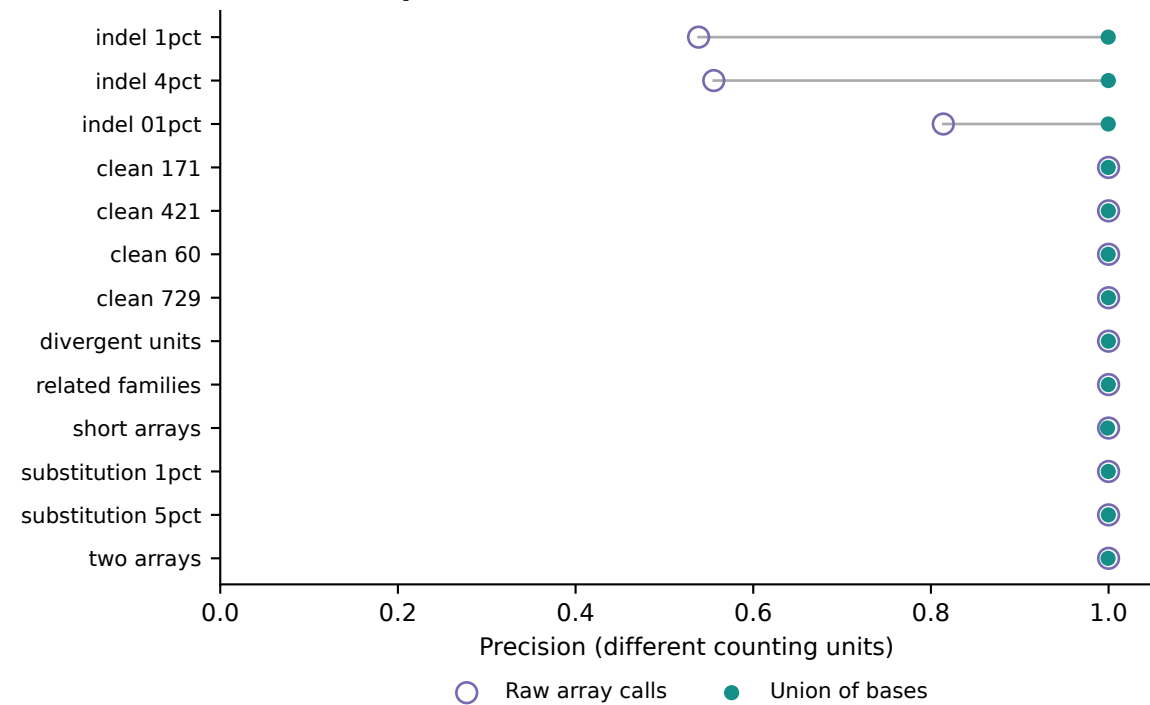

A Small indels change the sequence endpoint

ULTRA: 10 reads per dataset, seed 1101

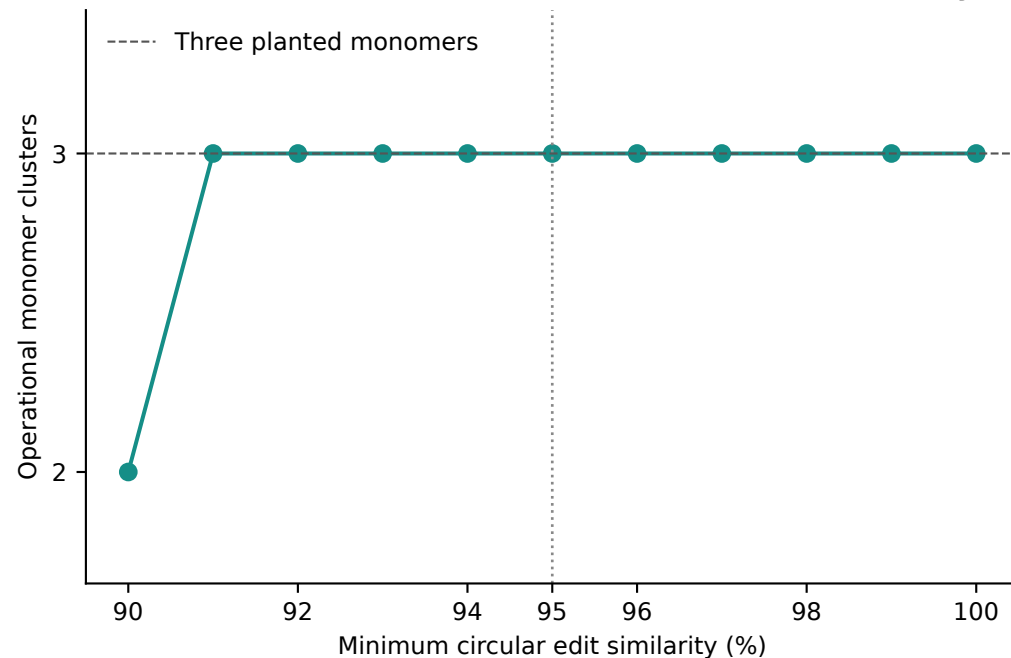

B Duplicate calls differ from wrong bases

TRF: all 13 positive scenarios, 100 reads each

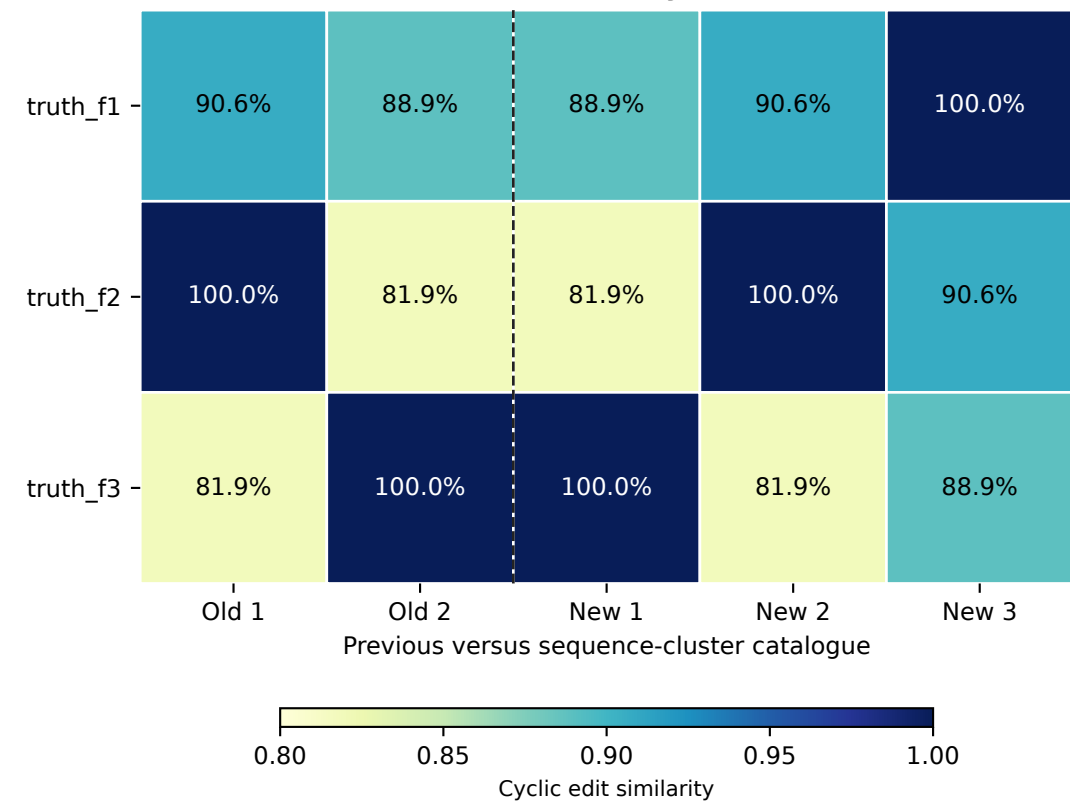

C Sequence resolution is explicit

Related-monomer case: seed 2101, 70 candidate arrays

D Independent sequence evidence for recovery

Same seed-2101 reads; similarity includes indels

Development/diagnostic evidence; no held-out superiority or biological-family taxonomy claim
