

Figure 5 | Independent reads support three residual family-specific deficits and define three unresolved cases

A

Preselected candidates were assessed with orthogonal reads
Six newer-assembly families were fixed before independent-read inspection

Ey15-2

TXF000002

TXF000154

TXF001517

Illumina k=21 and k=31
assembly/read ratio < 0.6 at both k values

Macadamia

TXF000496

TXF000563

TXF000695

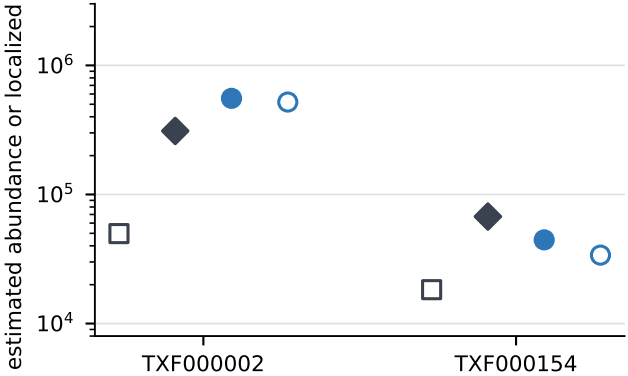

Illumina k=21 and k=31; ONT direction
assembly/read ratio < 0.6 at both k values

3 supported
3 unresolved

B

Ey15-2 supported families

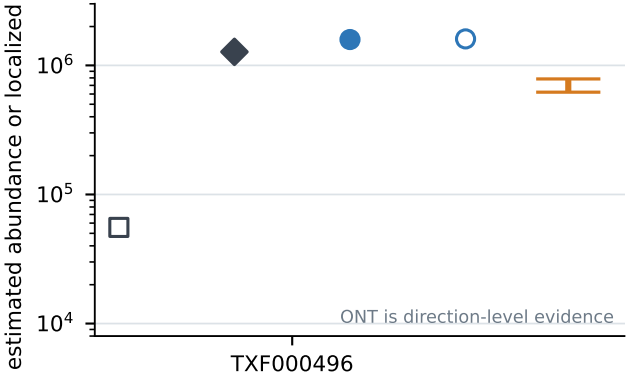

Assembly square; HiFi diamond; Illumina circles

C

Macadamia supported family

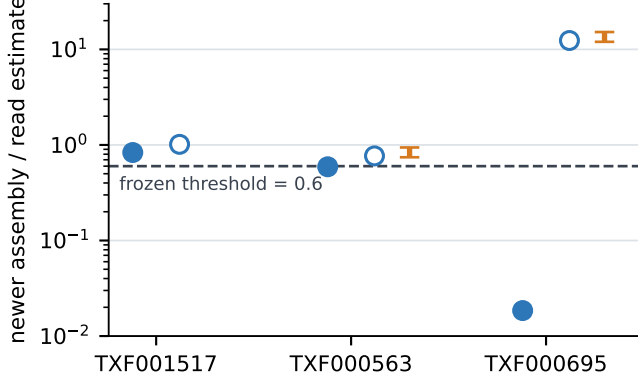

Assembly square; HiFi diamond; Illumina circles; ONT range

D

Three candidates remain unresolved

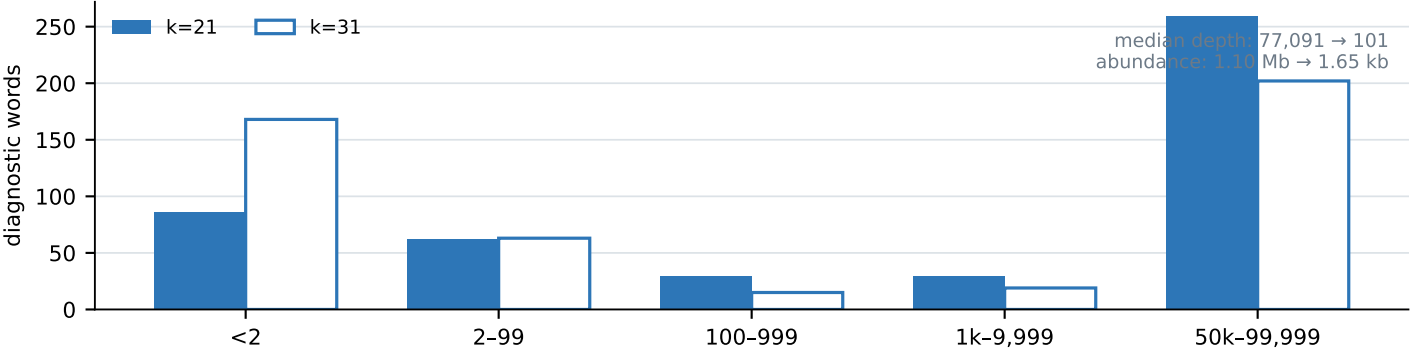

Illumina k=21 filled; k=31 open; orange, ONT range

E

TXF000695 has a cross-k median-boundary shift

467 diagnostic words per k; low and high depth components are retained

F

Evidence-state boundary

Circle, cross-platform support; diamond, unresolved

A family-level disposition, not a population accuracy estimate.

Read-assembly abundance ratios and ranges show direction-level evidence. They do not measure physical missing bases or establish absolute repeat copy number.
